

Laser Therapy and Post-Surgical Pain Management

Laser therapy provides a non-invasive, pain-free, surgery-free, drug-free solution for treating a variety of conditions. It has been proven effective at reducing pain and inflammation for most post-surgical procedures, as well as in aiding healing.

What are some surgical procedures that can benefit from laser therapy?

- Spays and neuters
- Declaws
- Dental extractions and cleanings
- Wound closure and/or abscess treatment
- Orthopedic surgery sites

Ask your veterinarian to see if laser therapy can be added to your pet's plan of care.

About The Treatment

Relief and/or improvement is often noticed within hours depending on the condition and your pet's response. We highly recommend adding this innovative approach to treating pain for your pet for most post-surgery procedures, including dentals. For most procedures, your pet can benefit from a single treatment and receive increased comfort.

Our practice firmly believes that our mission is to keep our patients pain-free. Laser therapy offers another modality that is consistent with industry standards. Adding laser therapy to your pet's treatment will enhance pain relief, reduce inflammation and swelling, and reduce instances of self-trauma. Most importantly, adding laser therapy can positively impact your pet's healing time.
